## Intravenous Injections

**Our goal** is to help preserve, diagnose, treat, and restore your trees to their healthy, beautiful state. Sometimes conventional methods of preserving plant health, such as deep root fertilization or foliar treatments, are not effective or do not provide fast enough results. We utilize the most effective treatment technology: **Tree Intravenous Injections.**

**Iron chlorosis** is a very common problem with many of our trees in North Texas. Leaves with iron chlorosis will develop a yellow color with a network of dark green veins. If left untreated the trees will begin to decline and die. Red Oaks and Sweetgums are especially vulnerable. With **Tree IV Injections**, we can distribute iron directly into the tree's vascular system for fast uptake and distribution throughout the tree.

**Palm IV Injection:** This injection is formulated especially for palms. It provides Nitrogen, Potassium, Iron, Manganese and other essential nutrients for healthy green foliage. Manganese helps alleviate symptoms of Frizzle Top, which is a Manganese deficiency found in new palm fronds.

**Fungicide and Antibiotic Injections:** For some diseases, such as Fire Blight and Oak Wilt, **Tree IV Injections** are the only way to ensure effective uptake and distribution of fungicides and antibiotics.
